

# PIPELINE

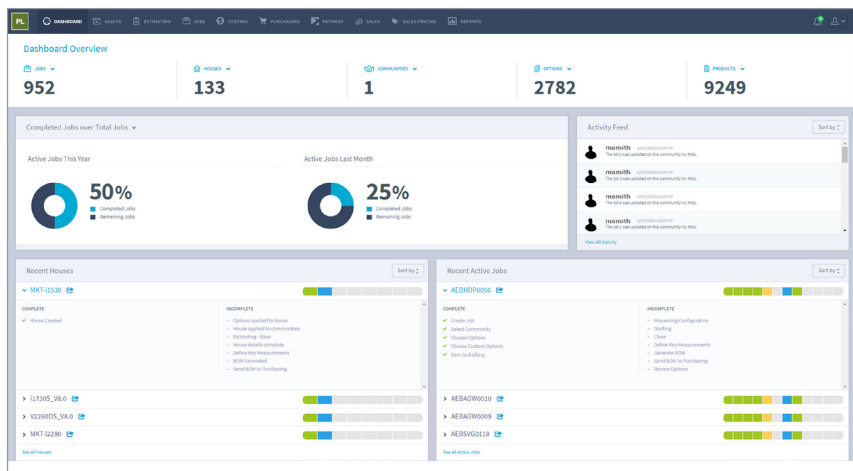

## Cloud Estimating

### Overview

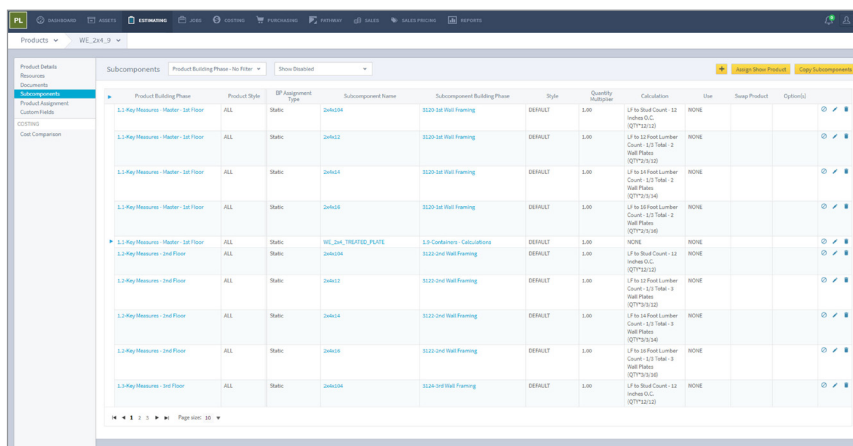

Pipeline is a web-based material management and estimating logic software solution that was built from the ground up specifically to help homebuilders solve problems. Pipeline's module-based functionality lets you buy only what your business needs. Our Cloud Estimating Module allows you to import the building information modeling (BIM) software data to a full bill of materials (BOM). Our Costing Module prevents redundant tasks by using a complete bill of materials to align with various vendors' costs and establish a true cost to construct. And finally, our Purchasing Module issues accurate purchase orders using the latest job estimate established at a given time.

### Features

- Captures all option changes, which allows you to create site-specific purchasing and back-office documents
- Full master-plan estimates with delta BOM reports
- Purchase orders from lot-specific, as-built reports
- Managing options for all assets relating to houses, communities and lots
- Option-on-option scenarios
- Full array of materials using dynamic assemblies
